

# Models for remotely-sensed sea surface heights and temperatures in ocean data assimilation

Alexey Kaplan and Mark A. Cane  
*Lamont-Doherty Earth Observatory  
of Columbia University*

JCSDA 5<sup>th</sup> Workshop on Satellite Data Assimilation  
May 1-2, 2007, Marriott Inn and Conference Center  
University of Maryland, College Park, MD

**The goal: to address data error modeling for data assimilation purposes, reflecting the difference in averaging of physical field by the model grid and by the observing systems.**

**Consider a typical situation in the ocean modeling:**

**Model: grid resolution – 30km x 60km,**

**Data: Sea surface height altimetry – 7km footprint;**

**SST – 1-4-25km averages, depending on the product;**

**In situ observations – local.**

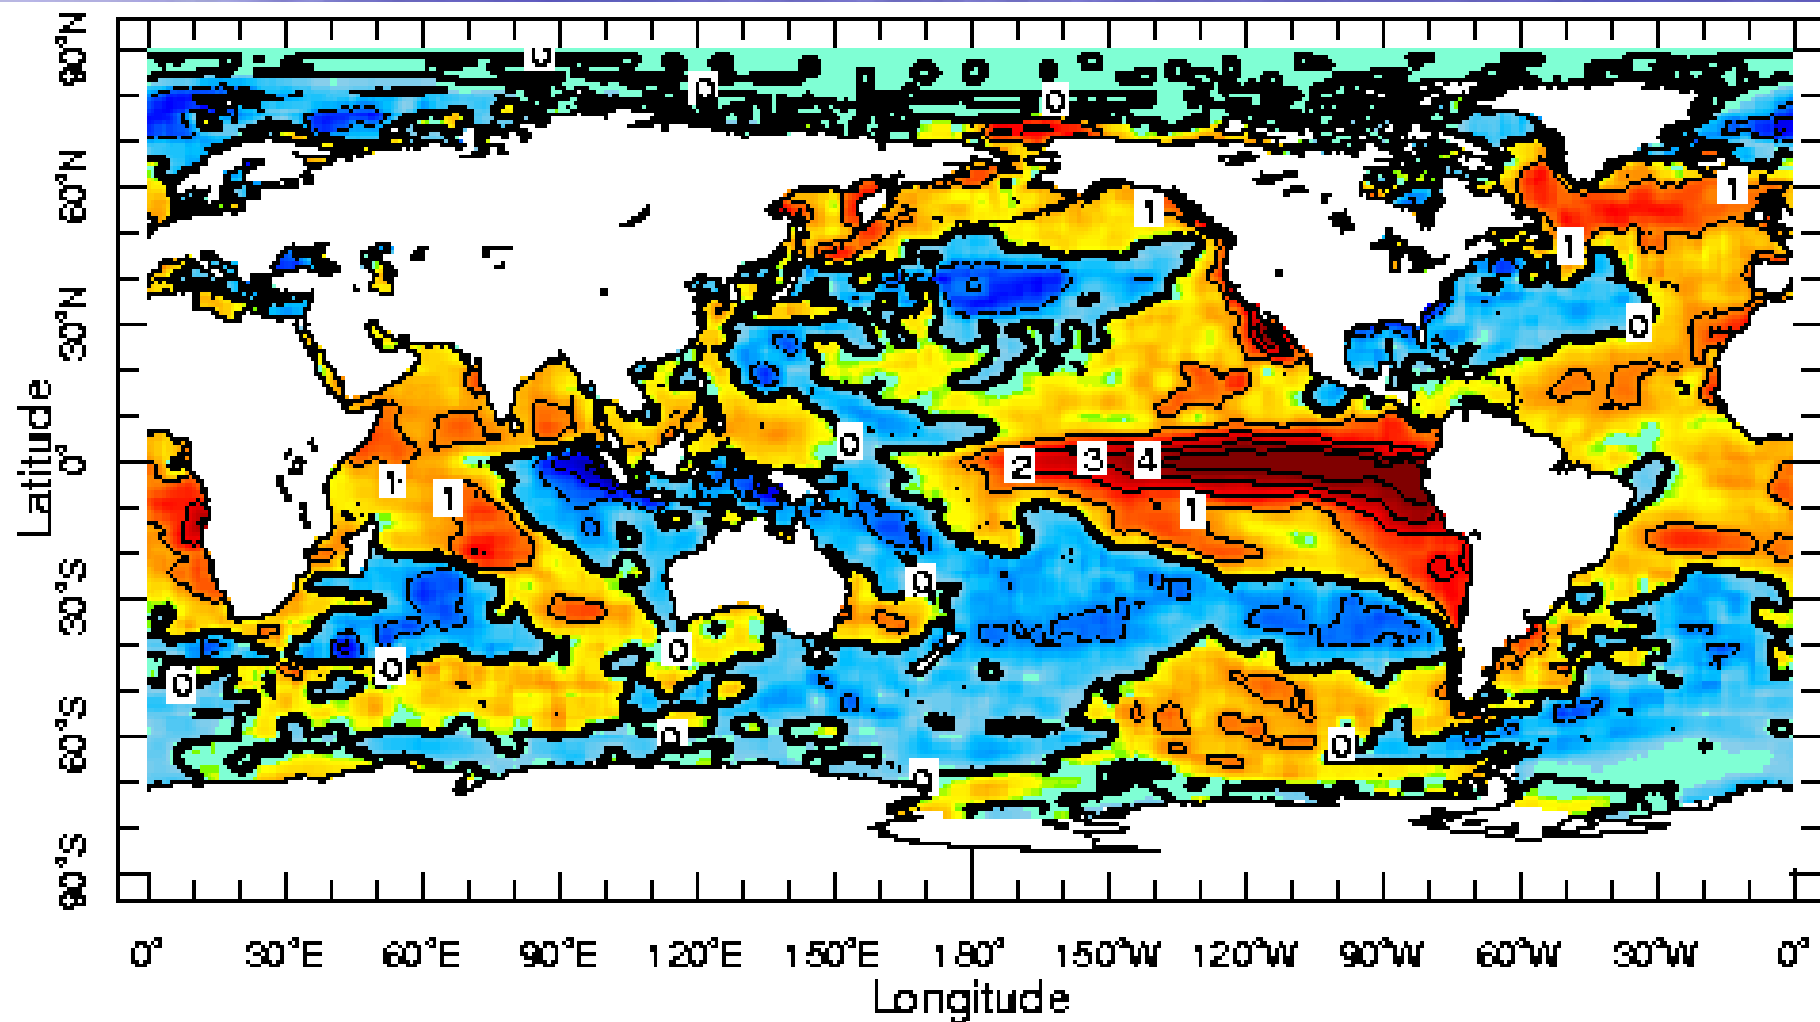

**What is the error of the data with regards to the model grid values?  
It needs to be specified for the assimilation procedures.**

**In addition to measurement error of the data, we need to take into account the error due to the difference in averaging of the physical field by the model and by different types of the observing systems.**

**Are our error estimates consistent with each other and with data differences?**

Let's start from a very simple problem: explaining the difference between gridded versions of satellite and in situ SST data

# Sea Surface Temperature Anomaly (Reynolds and Smith's NCEP OI v.2)

9-15 Nov 1997

What is the error in the binned obs mean  
(as estimates of the "true" bin area average)?

$F(x,y)$  [or  $F(x,y,t)$ ]

Error variance  
for the mean  
of N observ is  
 $\sigma^2/N$

# Error in 4 degree ICOADS bins (NCEP OI analysis is used as "truth"): Actual and theoretical error variance differ by a factor of two

## Actual

$\text{sqrt} [ ( ( [ \text{RSA COADS sst obs} ] - \text{NCEPOI bm} ) \text{ ssta} ) \text{ squared} ]$   
point mean:  $0.68047 \pm 0.51474$  range [0.14966 to 5.4339]

## Theoretical

$\text{sqrt} [ ( ( \text{vRTG sstvar} ) \text{ squared} ) / ( [ \text{RSA COADS sst obs Nobs} ] ) ]$   
point mean:  $0.47226 \pm 0.35218$  range [0.0432598 to 2.1288]

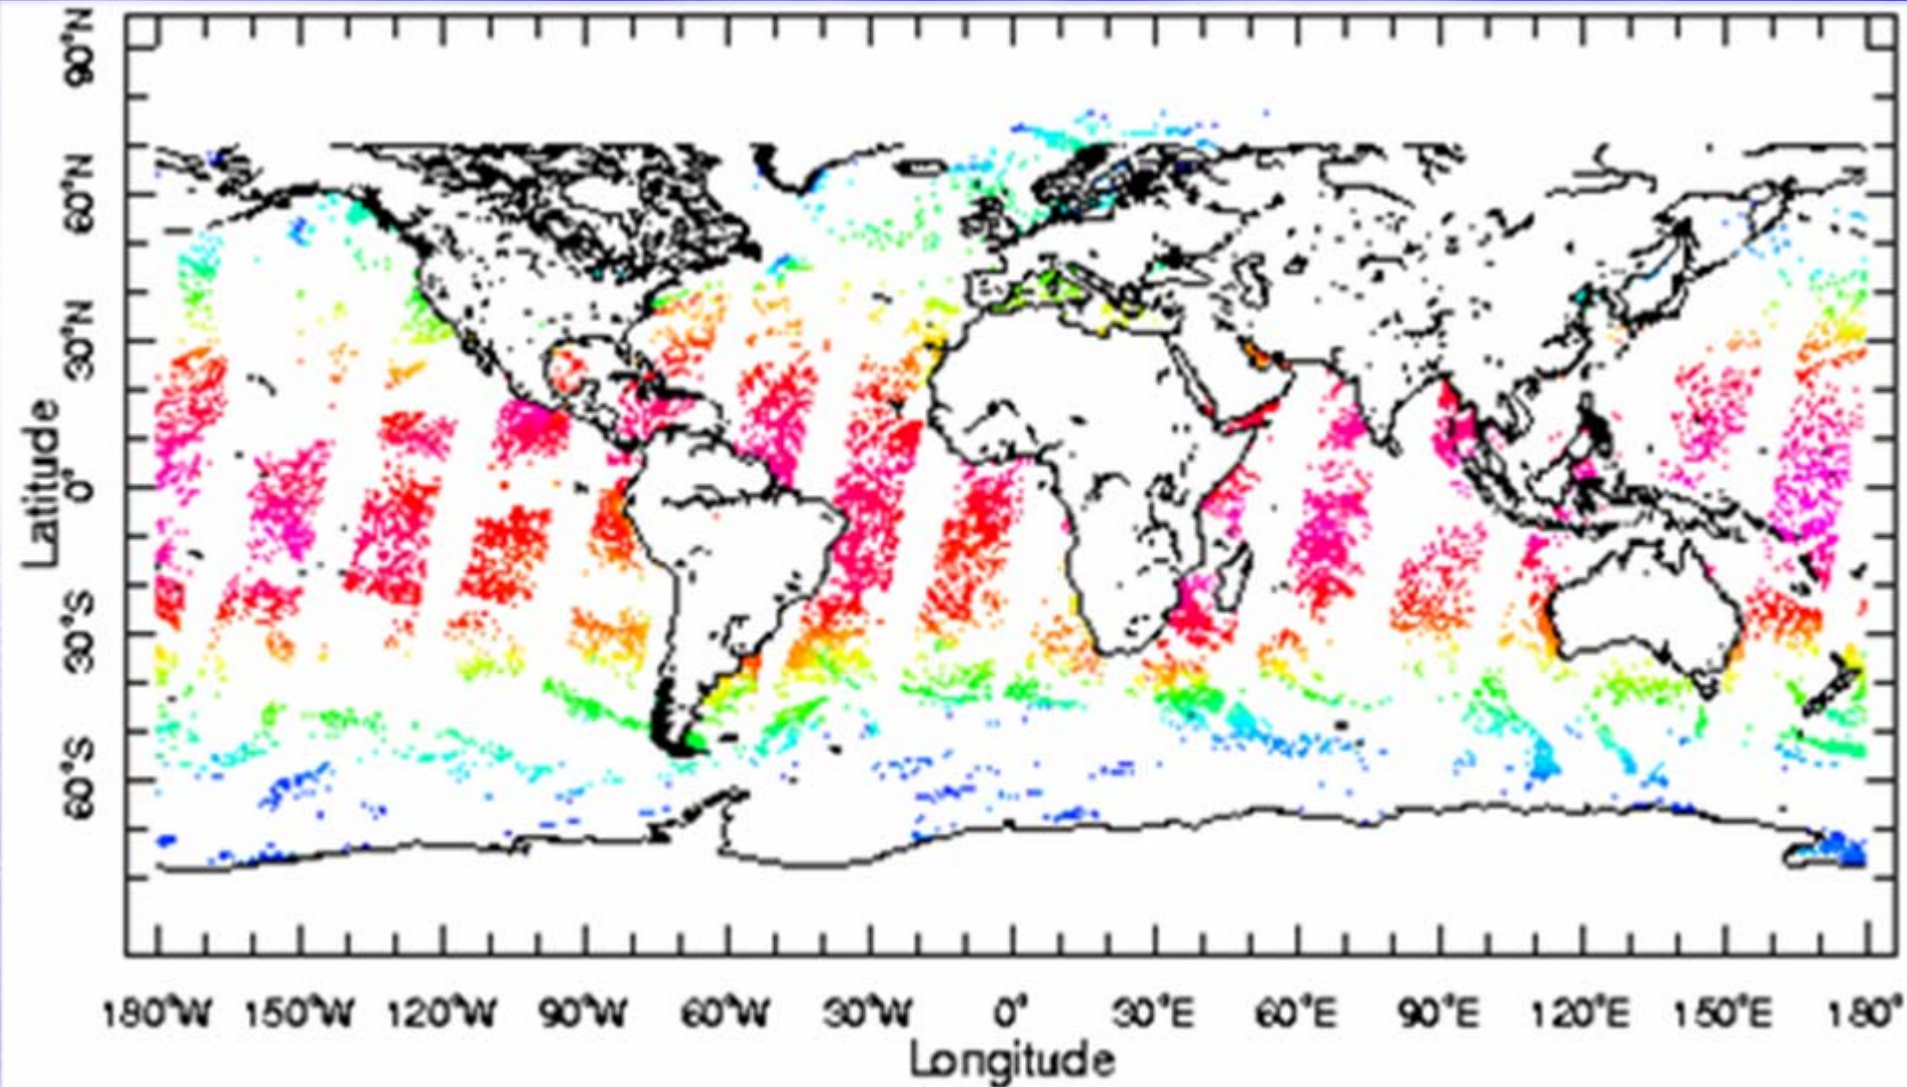

High-resolution brought in by satellite data can help pinpoint natural SST variability

# MODIS Scanning Swath

# Satellite Sea Surface Temperature Measurements for one day

Pathfinder SST:  
Monterey Bay,  
Oct 8, 1996  
4km resolution

A few weeks of background  
processing of 20 years of daily 4km  
maps of Pathfinder AVHRR SST  
later

we have SST variability inside  
1x1 boxes estimated...

# Small-scale variability in SST, °C

## Spatial Variability

## Temporal Variability

## Diurnal Variability

## Total Variability

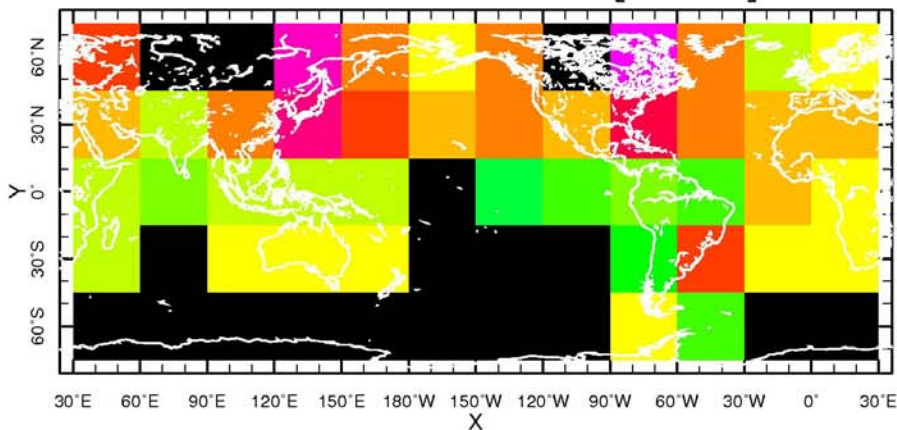

# STD[SST] in ICOADS $1^{\circ} \times 1^{\circ}$ bins

0 0.2 0.4 0.6 0.8 1 1.2 1.4 1.6 1.8 2

# Effects of measurement error

STD[SST] in ICOADS  $1^{\circ} \times 1^{\circ}$  bins Kent and Challenor [2006] estimate

# Sampling error estimates for a single observation

STD[SST] in  $1^{\circ} \times 1^{\circ}$  monthly bins

With the addition of KC2006 estimate

# Modeling in situ data error for 1° bins

Modeled as  $\langle \sigma / \sqrt{n_{\text{obs}}} \rangle$       Actual MODIS-ICOADS STD

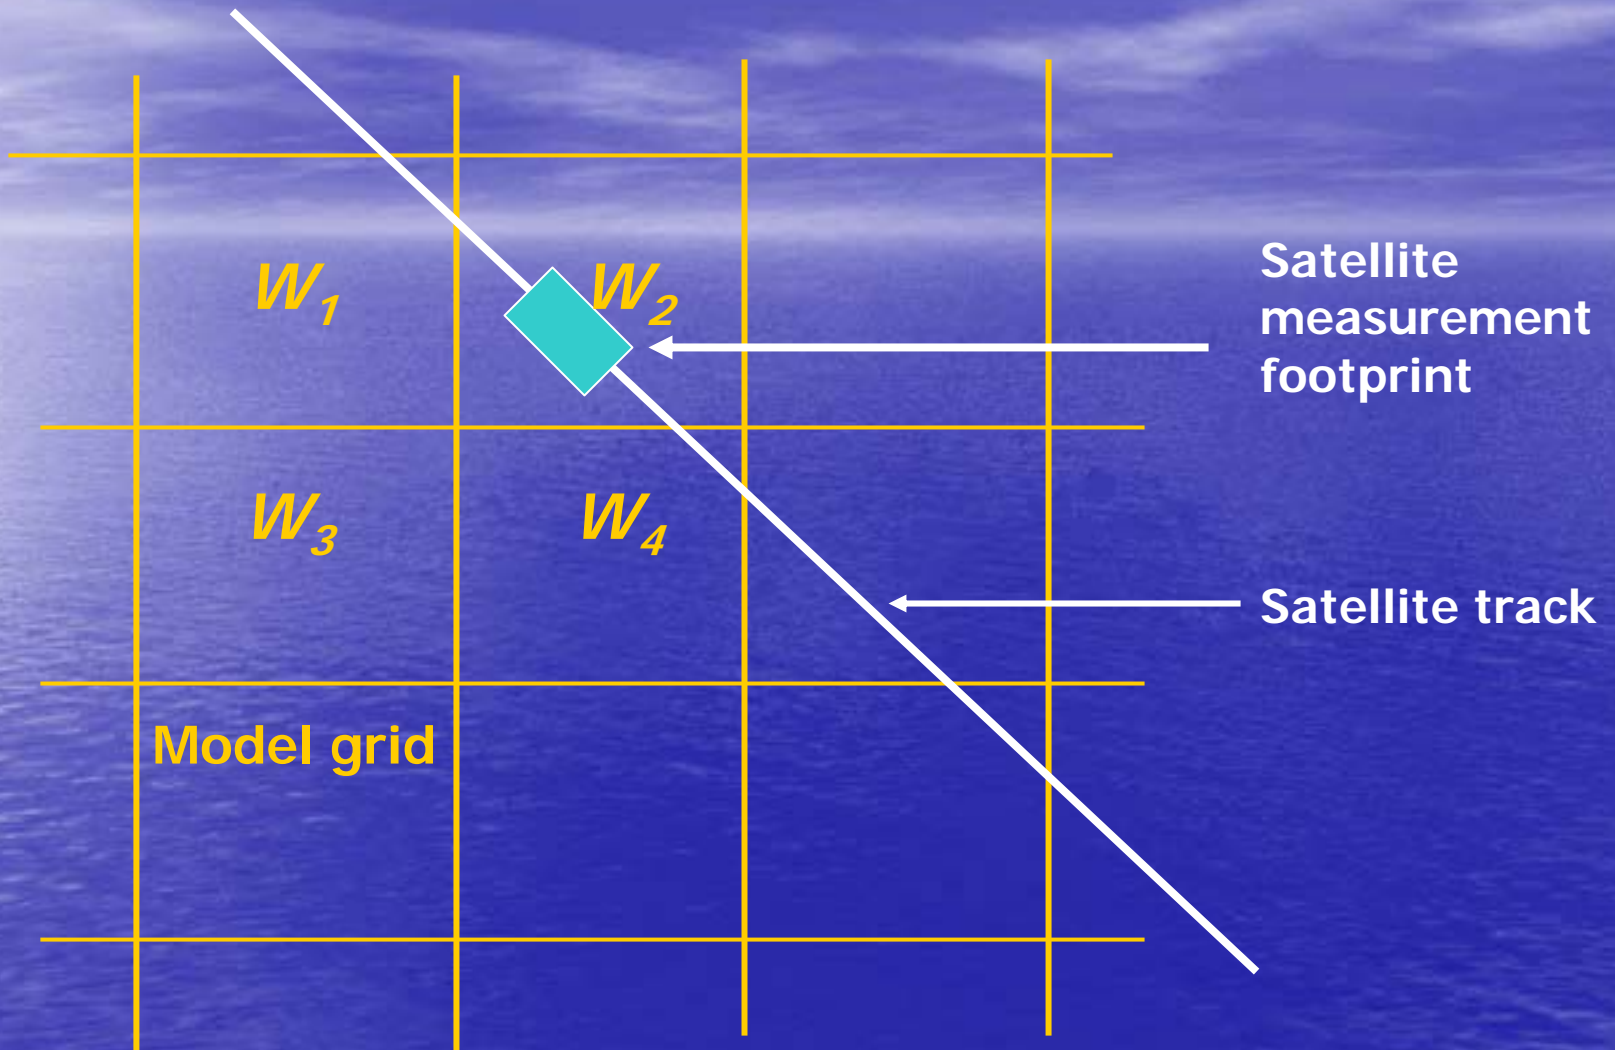

What we have learned from  
the SST analysis:

For representing 1degX1degX1month  
bins both (in situ) measurement error  
and natural SST variability contribute  
significantly into the effective  
observational error

# Model and data values

$$S^o = Hs = W_1s_1 + W_2s_2 + W_3s_3 + W_4s_4$$

$$Hs + \varepsilon = s^o$$

$$Hs = \int W(\vec{x})s(\vec{x})d\vec{x}$$

$$s^o = \int W^o(\vec{x})s(\vec{x})d\vec{x}$$

$$\varepsilon = \int (W^o(\vec{x}) - W(\vec{x}))s(\vec{x})d\vec{x}$$

# Spectral representation of data error

Assume

$$s(\vec{x}) = \int f(\vec{k})e^{i\vec{k}\vec{x}}d\vec{k},$$

then

$$\varepsilon = \int d\vec{k}f(\vec{k}) \int (W^o(\vec{x}) - W(\vec{x}))e^{i\vec{k}\vec{x}}d\vec{x} = \int w(\vec{k})f(\vec{k})d\vec{k},$$

where

$$w(\vec{k}) = \int (W^o(\vec{x}) - W(\vec{x}))e^{i\vec{k}\vec{x}}d\vec{x}.$$

Let  $P(\vec{k})$  be a power spectrum of  $s(\vec{x})$ :

$$\langle f(\vec{k})f(\vec{k}')^* \rangle = P(\vec{k})\delta(\vec{k} - \vec{k}').$$

Then

$$\langle \varepsilon^2 \rangle = \int P(\vec{k})|w(\vec{k})|^2d\vec{k}.$$

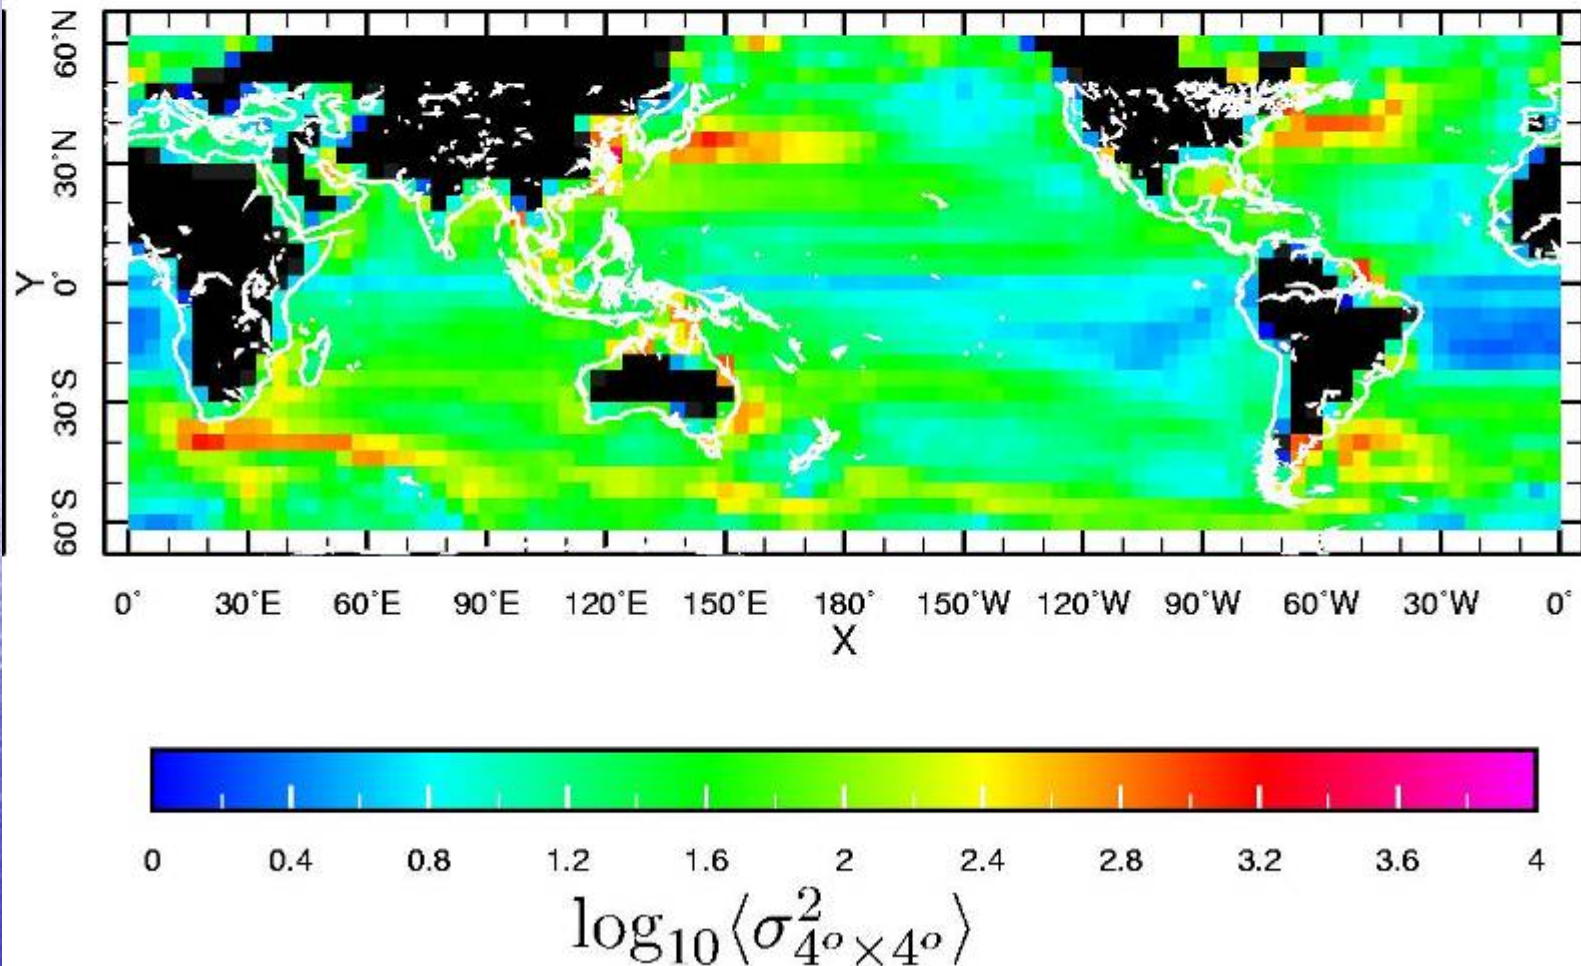

# Rough Approximation

Suppose we want to use a satellite retrieval with a footprint of size  $l$  on the ocean surface for the assimilation to a model with the grid size  $L$ . By using the footprint value as an estimate for an average over the model grid box, we commit a sampling error. If a wavenumber power spectrum  $P(k)$  of the physical field is isotropic and known, the expression for this error is very simple

$$\sigma^2 = \int_{2\pi/L}^{2\pi/l} P(k) dk.$$

If the field is not isotropic and a more sophisticated model-data interpolation operator is used, the formulas quickly becomes more complicated, but as long as the power spectra estimates are available, model and observing system geometries are known, the computation of sampling error variances and covariances are straightforward.

(d)  $\langle \sigma_{4^\circ \times 4^\circ}^2 \rangle, \text{ cm}^2$

Sea surface height from 1/3 degree AVISO analyses  
(Ducet et al. 2000)

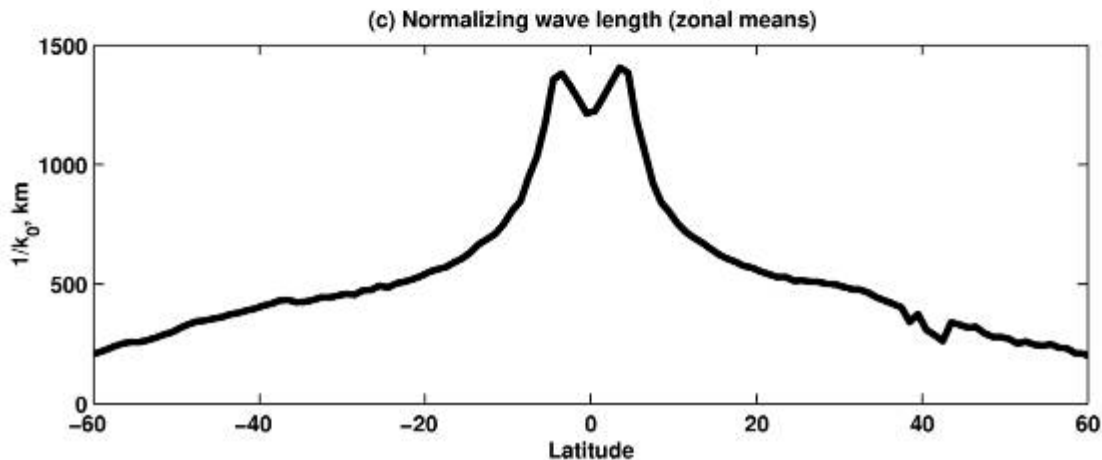

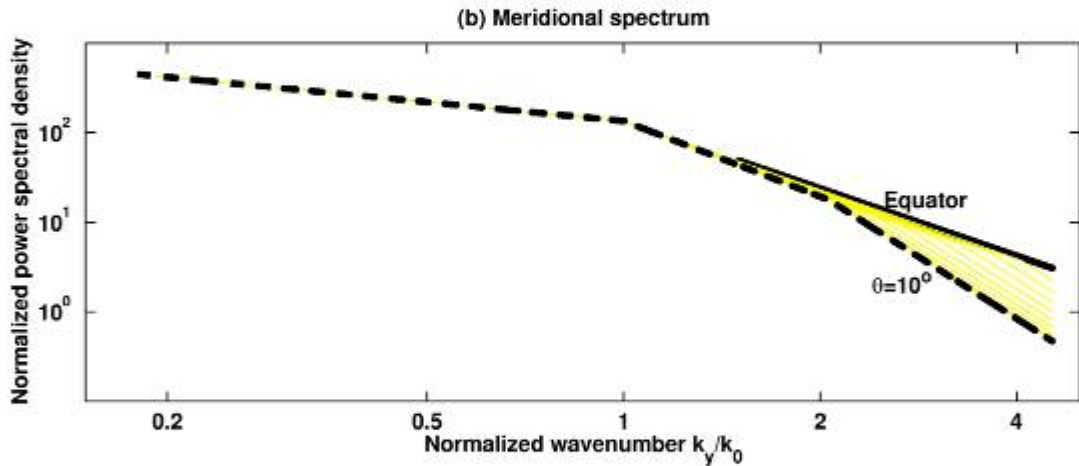

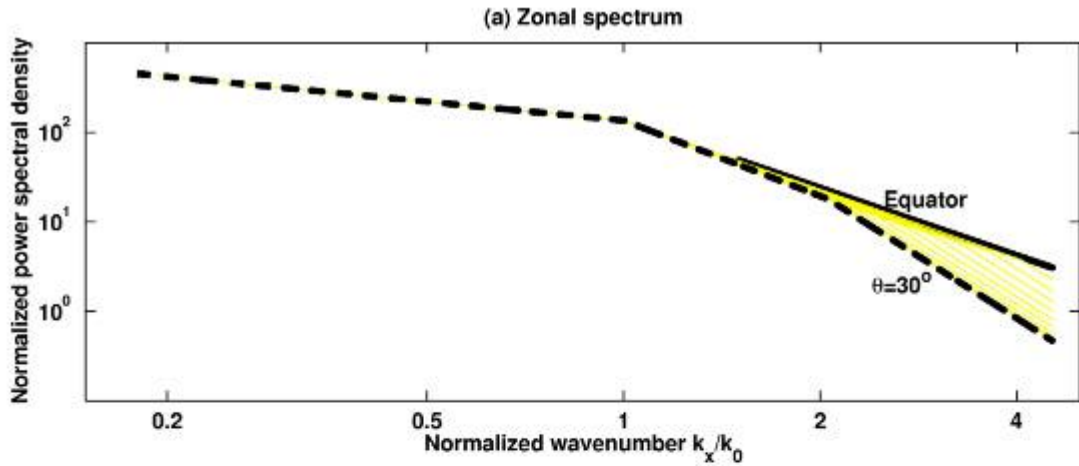

FIG. 4.8. Annual mean of eddy energy in the ocean as observed by satellite altimeter during December 1986 - November 1987. The eddies are detected by measuring the shape of the sea surface, which bulges downward in cyclonic and upwards in anticyclonic eddies as explained in Figs 2.7 and 3.3. The quantity shown is the standard deviation of observed sea level (cm) from the mean sea level over the observation period. From Fu *et al.* (1988)

Wavenumber spectrum for sea surface heights: Combining Stammer (1997) tropical and midlatitudinal spectral forms [Rossby radius is from Chelton et al. (1998)]

# TOPEX [*Ducet et al. 2000*]

## Time-space separation of small-scale sea level height variability

(a) Total SSV  $\sigma_{4^{\circ} \times 1^{\circ} \times 1 \text{ month}}(s)$

$\text{sqrt} [ ( \text{ssv} + \{ \text{stvg stv} \} ) \text{squared} ]$   
 point mean:  $6.1281 \pm 4.9101$  range [0.0228197 to 80.611]

(b) Short-term temporal variability  $\sigma_{1 \text{ month}}([s]_{4^{\circ} \times 1^{\circ}})$

stvg stv  
 point mean:  $2.9553 \pm 2.7528$  range [0.000756442 to 46.822]

(c) Spatial variability inside bins  $\sqrt{[\sigma_{4^{\circ} \times 1^{\circ}}^2(s)]_{1 \text{ month}}}$

ssv  
 point mean:  $5.1688 \pm 4.3149$  range [0.0 to 73.023]

(d) Ratio  $\gamma$  of temporal to spatial variability

$[\text{stvg stv}] / [ \text{sqrt} ( \text{ssv} - 1.00000\text{E-}07 ) \text{squared} ]$   
 point mean:  $0.94132 \pm 4.3132$  range [0.0260134 to 170.47]

# ERROR ESTIMATE VERIFICATION USING IN SITU DATA (TIDE GAUGES)

SSV ratio from tide gauges and TOPEX

Verification of tide gauge model error

# Conclusions

1. Effective data error depend on the model resolution (and averaging intrinsic in individual observations).
2. The richness of satellite data allows us to specify and use for error modeling spectral representations of assimilated fields.
3. Error due to averaging difference may exceed the nominal measurement error.

*Gratefully acknowledging collaboration with Christian Keppenne and Michele Rienecker and support from Joint Center for Satellite Data Assimilation.*
